Get

Line 14

Code:

```
[HttpGet(Name = "GetWeatherForecast")]
        public IEnumerable<WeatherForecast> Get()
        {
            return Enumerable.Range(1, 5).Select(index => new WeatherForecast
            {
                Date = DateOnly.FromDateTime(DateTime.Now.AddDays(index)),
                TemperatureC = Random.Shared.Next(-20, 55),
                Summary = Summaries[Random.Shared.Next(Summaries.Length)]
            })
            .ToArray();
        }
```

Issues Found:

⚠️ Warning: The function does not handle potential exceptions that may occur during the execution of the Random.Shared.Next() method or the DateOnly.FromDateTime() method.

ℹ️ Info: The function uses magic numbers (e.g., 1, 5, -20, 55) which can make the code harder to understand and maintain.

⚠️ Warning: The function does not check for null references before accessing the Summaries array.

💡 Suggestion: Consider adding error handling and input validation to make the function more robust, and define named constants for magic numbers to improve code readability and maintainability.
